## INTRODUCTION

The *Journal of International Accounting Research* publishes articles that increase our understanding of the development and use of international accounting and reporting practices or attempt to improve extant practices. International accounting is broadly interpreted to include the reporting of international economic transactions; the study of differences among practices across countries; the study of interesting institutional and cultural factors that shape practices in a single country but have international implications; and the effect of international accounting practices on users. The *Journal of International Accounting Research* has a diverse readership and is interested in articles on auditing, financial accounting, managerial accounting, systems, tax, and other specialties within the field of accounting. The journal is open to research using a variety of research methods, including empirical-archival, experimental, field studies, and theoretical. The importance of the findings and the rigor of the analysis are the factors that determine acceptability. The journal may include sections for Notes (shorter articles), Commentaries, and Book Reviews.

## CITATION INDICES

The *Journal of International Accounting Research* is a highly respected journal in the accounting and economics categories. This section provides data on rankings drawn from Scopus (Elsevier, 2018), presents citation counts from Elsevier’s CiteScore, and includes international journal listings and ratings from the most recent data available.

### Scopus Rankings

An important measure of the quality of a journal is to understand how its intellectual contributions are valued by measuring the extent of citations made to papers published in that journal. Elsevier’s Scopus database of abstracts and citation of peer-reviewed papers has 50m records in more than 22,000 titles published by 5,000 publishers (<http://www.elsevier.com/online-tools/scopus>). Scopus provides a foundation for new journal metrics that have become increasingly influential in recent years (<http://www.journalmetrics.com>). Important metrics based on Scopus include Source-Normalized Impact per Paper (SNIP) and SCImago Journal Rank (SJR). Journal citation metrics based on Scopus are increasingly seen by many senior university administrators as a means of normalizing the differences in publishing patterns between disciplines.

The key aspect of SNIP is to measure citation impact by “normalizing” citation values for the radically different patterns of citation between disciplines. SNIP also counters the various manipulations of citation rankings. The summary of SNIP is:

- “Takes a research field’s citation frequency into account
- Considers immediacy—how quickly a paper is likely to have an impact in a given field
- Accounts for how well the field is covered by the underlying database
- Counters any potential for editorial manipulation” (<http://www.journalmetrics.com>)

The key aspect of SJR is the recognition that not all citations are equal. A citation in a more influential journal should count more than a citation in a less influential journal. The summary of SJR is:

- “Is weighted by the prestige of the journal, thereby ‘leveling the playing field’ among journals
- Eliminates manipulation: the only way to raise the SJR ranking is publish in more reputable journals
- ‘Shares’ a journal’s prestige equally over the total number of citations in that journal
- Normalizes for differences in citation behavior between subject fields” (<http://www.journalmetrics.com>)

Table 4 shows the SNIP and SJR rankings for 2015 to 2017 (most recent data) with comparable data for AAA peers, as well as those in the accounting and finance disciplines.

## CiteScore

In 2016, CiteScore was added to the Scopus metrics. CiteScore measures the citations on articles published in the previous 3 years. All article types are counted. Scopus metrics now include Source Normalized Impact per Paper (SNIP), SCImago Journal Rank (SJR), and citation and document counts and percentage cited (CiteScore). Another way of looking at this is SNIP is article impact, SJR is the journal impact, and CiteScore is a simplified view of the journal’s citation analysis. The following images show the CiteScore trend for *JJAR*, and the CiteScore table lists the CiteScore for each journal in the AAA collection indexed in Scopus.

### ***Australian Business Deans Council Journal Rankings List (2016)***

The influence of this ranking goes well beyond Australia.

<b>Rank</b>	<b>Interpretation</b>
A*	Best or leading journal in its field—publishes outstanding, original, and rigorous research that will shape the field. Acceptance rates are typically low and the editorial board is dominated by leading scholars in the field or subfield, including from top institutions in the world. Where relevant to the field or subfield, the journal has the highest impact factors or other indices of high reputation.
A	Highly regarded journal in the field or subfield—publishes excellent research in terms of originality, significance, and rigor; has competitive submission and acceptance rates; excellent refereeing process; and, where relevant to the field or subfield, has higher than average impact factors. Not all highly regarded journals have high impact factors, especially those in niche areas.
B	Well-regarded journal in the field or subfield—publishes research of a good standard in terms of originality, significance, and rigor, and papers are fully refereed according to good standards and practices but acceptance rates are higher than for Tiers A* and A. Depending on the field or subfield, will have a modest impact factor and will be ISI-listed.
C	A recognized journal—publishes research that is of a modest standard and/or is yet to establish its reputation because of its newness. This tier is more inclusive than the other categories. Only includes refereed journals.
